Pupil Notes Part 2

Structures & Naming

5.2 Naming Molecules

This lesson largely revises the principles behind naming and how they can be applied in more complex molecules

Naming Alkanes

This activity deals with how to name branched alkanes using systematic names, i.e. names that follow a very definite system which is based on the structure of the molecule.

In a **str** **-chain** hydrocarbon, all the **car** atoms in the molecule are linked one after the other in a **sin** continuous chain.

In a **bran** **-chain** hydrocarbon, the molecule has one or more **si** **chains** of carbon atoms off the main chain.

Due to **bran**, it is possible to have **different struc** arrangements for the **same mol** formula. **ane**, C_4H_{10} , has two **different** structures called **iso**. Clearly both of them cannot have **exactly** the same name.

Naming Rules for Alkanes

1. The **longest chain** defines the main chain and the last part of the name
2. **Numbering** of the main chain starts from the end that gives the lower overall number positions for side branches
3. **Side branch** names end in **'-yl'** and depend on the number of carbon atoms in them: *methyl* for 1 carbon, *ethyl* for 2 carbon atoms, *propyl* for 3 carbon atoms, etc.
4. **Alphabetical** order is used if different side branches appear in the same structure (*ethyl* before *methyl*).
5. **Hyphens** are used before or after numbers that come next to letters within a name (2-ethyl-3-methyl..)
6. **Commas** are used between numbers showing more than one of the same side branch (2,2,3-trimethyl..)

| Full structural formula | Systematic name |
|--|-----------------|
| $ \begin{array}{ccccccc} & & & & & \text{H} & & & \\ & & & & & & & & \\ & & & & & \text{H}-\text{C}-\text{H} & & & \\ & & & & & & & & \\ \text{H} & - \text{C} & - & \text{C} & - & \text{C} & - & \text{C} & - & \text{C} & - & \text{H} \\ & & & & & & & & & \\ & \text{H} & & \text{H} & & \text{H} & & \text{H} & & \text{H} \end{array} $ | |

| 3-methylpentane | |
| 2,4-dimethylhexane | |

Branched Alkenes

This activity considers how to use systematic names to indicate both the positions of side branches and the position of the double bond in the alkene structure.

but-1-ene

There are even more **iso** possible in the *alkene* family. Again there are **str** -chain alkenes and **bra** -chain alkenes.

In addition, it is possible to change the **pos** of the **dou** bond to introduce even more *different struc formulae*.

Branched Alkene Structures

Alkanols

This activity revises the alkanol family

The **func** **group** in alkanols is the **Hydr** **group**.

The **alk** can be thought of as 'substituted alkanes' - a **hydroc** chain with the **hydr** group replacing one of the **hydr** atoms.

Like **wa**, alkanols are **cov** molecules and, as a result, are **very poor cond** of electricity.

Like **wa**, alkanols have a **pol** O—H bond which allows **hyd** bonding between molecules. As a result, water and smaller alkanols will 'dissolve' in each other as the **stre** of their **intermolecular** forces are very **sim**.

As well as sharing the same **Gen** **formula**, the **phy** **properties** of the alkanols such as **melting point (inc)**, **boiling point (inc)** and **solubility in water (dec)** show a steady trend as the **molecular size** increases. For these reasons, the alkanols can be described as a **homo** **series**.

| Property | Result |
|-------------------|---------------|
| <i>Appearance</i> | |
| <i>Solubility</i> | |
| <i>pH</i> | |
| <i>Conduction</i> | |
| <i>Burning</i> | |

Combustion of Ethanol

This activity is about the products of combustion reaction of ethanol

The **comb** of ethanol can be referred to as **oxi** on the basis that the **car** and **hydr** are 'gaining oxygen'. Later in this topic *mild oxidation* of alcohols will lead to totally different, and much more important, products - **aldehydes**, **ketones** and **carboxylic acids**.

Straight-Chain Alkanols

This activity considers how to use systematic names to indicate the position of the hydroxyl group in isomers

The position of the *hydroxyl* group can change to produce *isomers* without the need to introduce branches.

Shortened Structural

Systematic Name

Isomers don't have to be from the same homologous series

| <i>Straight-Chain Alkanols</i> | |

Branched-Chain Isomers

This activity considers how to use systematic names to indicate both the position of the hydroxyl group and the branch position in isomers of branched-chain alkanols

The 'longest chain' must include the functional group.

The chain is numbered from the end nearest the functional group

Primary, Secondary & Tertiary

This activity relates the classification of alcohols to their molecular structures

This is an example of a *prim alcohol*.

It is so-called because only *one carbon* is directly attached to the carbon with the *hydroxyl* group.

The *hydroxyl* group is at the *end of the chain*.

Systematic Name

Systematic
Name

This is an example of a *sec alcohol*.

It is so-called because *two car* are directly attached to the carbon with the *hyd group*.

The *hyd group* is *along the chain*.

mild
oxidation :

secondary
alcohol

ketone

Systematic
Name

This is an example of a *tertiary* alcohol.

It is so-called because *three car* are directly attached to the carbon with the *hyd group*.

The *hyd group* is at a *branched position* of the chain.

mild
oxidation :

tertiary
alcohol

no products from mild oxidation

Ring Structures

This activity looks briefly at the structures and names of the cyclalkanols

Molecular
Formula

Full
Structural

Systematic
Names

Cycloalkanols are examples of *sec* alcohols because there are *two car* attached to the carbon with the *hyd group* - the hydroxyl group is 'along the chain'.

Cycloalkanols are *not iso* of *alkanols*, because there are *two less hyd* in a ring structure compared to the equivalent chain structure.

Hydroxyl Group as Substituent

2-hydroxy-3-methylbutanoic acid

More Than One Hydroxyl Group

This activity demonstrates how the hydroxyl group is named in molecules with more important groups present.

In this molecule the **carb** acid group, $-\text{COOH}$, is **more imp** and the presence of the $-\text{OH}$ is signified by the use of the **prefix 'hydroxy'** rather than the normal **suffix '-ol'**

Other groups that you might meet as suffixes:-

$-\text{NH}_2$ **amine** becomes **amino**

$-\text{COOH}$ **carboxylic** becomes **carboxyl**

You are already familiar with:-

CH_4 **methane** becoming **methyl**

But may also see:-

$-\text{O}-\text{CH}_3$ becoming **methoxy**

This activity looks at the structures and names of two alcohols which have more than one hydroxyl group

The common name for this alcohol is **gly**.

It is used as **anti** in car **rad**.

It contains **two hyd** group and can be referred to as a **dih** alcohol or a **diol**.

The common name for this alcohol is **gly**.

It has various culinary uses including **ice-c**

It contains **three hyd** group and can be referred to as a **trih** alcohol or a **triol**.

Aldehyde Structures

This activity considers the structures and systematic names of the alkanal series of aldehydes.

An **alkanal** is a compound which contains the **carbonyl** group at the end position of a hydrocarbon chain in which all the carbon atoms are linked by single bonds.

The **func** group of an aldehyde contains the **car** group and a **hyd** atom - —CHO.

The longest carbon chain includes the **func** group, so this molecule is named as **al**.

The chain is always numbered from the end with the —CHO functional group.

| <i>Alkanal Structures</i> | |
|--------------------------------------|---|
| <i>Name:</i> | 2-methylpropanal |
| <i>Full Structural Formula:</i> | |
| <i>Shortened Structural Formula:</i> | |
| <i>Name:</i> | |
| <i>Full Structural Formula:</i> | $ \begin{array}{ccccccc} & \text{H} & \text{CH}_3 & \text{H} & \text{H} & \text{H} & \text{H} \\ & & & & & & \\ \text{H} & - \text{C} & - \text{C} & - \text{C} & - \text{C} & - \text{C} & - \text{C} = \text{O} \\ & & & & & & \\ & \text{H} & \text{H} & \text{H} & \text{H} & \text{H} & \end{array} $ |

| <i>Shortened Structural Formula:</i> | $ \begin{array}{c} \text{CH}_3 \\ \\ \text{CH}_3\text{CH}_2\text{CHCH}_2\text{CH}_2\text{CH}_2\text{CHO} \end{array} $ |

Ketone Structures

This activity considers how to apply systematic names to the alkanone family of ketones.

An **alkanone** is a compound which contains the **carbonyl** group at a position within a hydrocarbon chain where all the carbon atoms are linked by single bonds.

The **func** group of a ketone is simply the **car** group by itself.

The longest carbon chain must include the **func** group. This molecule is named as **one**.

The chain is always numbered from the end nearest the —CO— functional group.

| Alkanone Structures | |
|-------------------------------|--|
| Name: | 4-methylhexan-2-one |
| Full Structural Formula: | |
| Shortened Structural Formula: | |
| Name: | |
| Full Structural Formula: | $ \begin{array}{cccccccc} \text{H} & \text{H} & \text{H} & \text{H} & \text{H} & \text{H} & \text{O} & \text{H} \\ & & & & & & & \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{H} \\ & & & & & & & \\ \text{H} & \text{H} & \text{H} & \text{H} & \text{H} & \text{CH}_3 & & \text{H} \end{array} $ |

| Name: | |
| Full Structural Formula: | |
| Shortened Structural Formula: | $ \begin{array}{c} \text{CH}_3 \\ \\ \text{CH}_3\text{CH}_2\text{CHCOCH}_2\text{CH}_3 \end{array} $ |

Alkanoic acids

This activity considers the structures, formulae and systematic names of some of the members of the alkanoic acid family.

Any molecule that contains the *carbonyl* group, $-\text{COOH}$, can be considered as a *carboxylic acid*. The molecule could have a *chain* structure, a *ring* structure, it could be *unsaturated* ($\text{C}=\text{C}$) or *unsaturated* ($\text{C}=\text{C}$ or $\text{C}\equiv\text{C}$).

The *alkanoic acids* are compounds which contain the *carboxyl group* joined to a hydrocarbon *chain* in which all the carbon atoms are joined by *single bonds*.

As usual, there are three ways to represent the formula of, for example, *pentanoic acid*

full structural
formula

shortened structural
formula

functional molecular
formula

For naming purposes, the *carbon* of the *carboxyl* group is always taken as number 1, and the 'longest' chain always starts with the *carboxyl* group. For example:

4-methylpentanoic acid

2-ethylbutanoic acid

2,2-dimethylpropanoic acid

Simple Esters

This activity deals with naming and drawing full and structural formulae for esters.

The 'best' way to think about an *ester* is to consider it as an *acid molecule* which has had its *hydroxyl atom* replaced by a *carbon chain* (an *alkyl group*).

Learn to draw acids and you should find esters easy.

ethyl propanoate

As is often the case, we 'start' at the end of the name. *Identify the acid* (look for the *carbonyl* $\text{C}=\text{O}$) and give the *ester* its *suffix* by changing the *-oic* ending to *-oate*.

The *carbon chain* (derived from the parent *alkane*) is the '*carbon*' name, *-ol* changed to *-yl*.

| <i>Ester Structures & Names</i> | |
